

FIREWALL SYSTEM AND METHOD WITH NETWORK MAPPING CAPABILITIES

ABSTRACT

A system, method and computer program product are provided for tracing a traffic event utilizing a firewall. Initially, a firewall is executed on a local computer. Next, traffic events between the local computer and a remote computer over a network are monitored utilizing the firewall. Further, the traffic events are displayed utilizing the firewall. In use, at least one of the traffic events is traced utilizing the firewall. Moreover, a map of the trace is displayed for effectively conveying information about the traffic event.
